

Supplementary Fig. S2. Activating transcription factor 3 (ATF3) upregulates the expression of programmed death-ligand 1 (PD-L1). (A, B) Verification of PD-L1 expression in 5-8F and S18 cell lines by western blot and immunofluorescence after overexpression of ATF3. (D) Verification of PD-L1 expression in HNE2 and HONE1 cell lines by western blot and immunofluorescence after knockdown of ATF3. NC, normal control; GAPDH, glyceraldehyde 3-phosphate dehydrogenase.
