

Supplementary Fig. S1. Immunohistochemical expression levels of calreticulin (A), clusterin (B), mucin-1 (C), and p27 (D), as evaluated using the H-score, in resection specimens after neoadjuvant chemotherapy, displayed in ascending order. Red bars denote patients who developed recurrence or distant metastasis during follow-up, while blue bars indicate patients who remained event-free. The black dashed line indicates the cut-off value used to dichotomize the lower and higher expression groups.
