

Supplementary Fig. S1. Kaplan-Meier disease-free survival curves according to invasion depth and histologic components in EGC: (A) T1a vs. T1b, (B) tub ≥10% vs. tub <10, (C) por ≥10% vs. por <10, (D) pcc ≥10% vs. pcc <10, (E) sig ≥10% vs. sig <10, (F) mixed-por vs. other, (G) mixed-pcc vs. other, and (H) mixed-sig vs. other. EGC, early gastric cancer; tub, tubular adenocarcinoma, well to moderately differentiated; por, tubular adenocarcinoma, poorly differentiated; pcc, poorly cohesive carcinoma, not otherwise specified; sig, signet-ring cell carcinoma; mixed-por, tub ≥10% and por ≥10%; mixed-pcc, tub ≥10% and pcc ≥10%; mixed-sig, tub ≥10% and sig ≥10%.
